FAQs

What are the infertility treatment options available in India for international patients?

Treatment for male infertility is one of the services provided in India, alongside vasectomy reversal, fine needle aspiration, microsurgery, and TESA (Testicular Sperm Aspiration). According to Mayo Clinic research, the treatments available include intrauterine insemination (IUI), in vitro fertilization (IVF), egg/sperm donation or freezing, surrogacy, and specific sperm retrieval procedures for azoospermia, oligospermia, or asthenozoospermia. Additionally, India offers services for the management of Polycystic Ovary Syndrome (PCOS), treatment for blocked fallopian tubes, and addressing low sperm count or motility. Techniques for fertility preservation, such as embryo preservation, are also available at the other end of this advanced spectrum.
